

The evaluation

You will have to work individually on two projects, each one will consist of two parts:

- implementation (preferably in R, but any other programming language is allowed).
- a written document (between 2-10 pages without the code).

The first project will be evaluated during the semester (in the second half), and the second one during the summer session.

Each project (the written document + the code) will be checked for similarities using Turnitin.

The deadlines for the projects will be announced later.

Each project will be graded and the average of the two grades will be the final grade.

- if you miss both deadlines, you will be ABSENT in the catalog.
- if you miss only one deadline, you will get the grade 1 for that project.
